Introduction

- Poisson-Boltzmann Equation: Models the interaction of macromolecules in a polarizable media.
- PINNs: Physics Informed Neural Networks. Method used to solve PDEs.

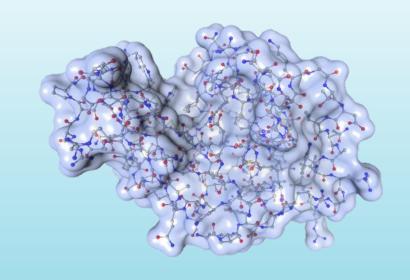

The aim is to solve the Poisson-Boltzmann equation using the *Extended Physics Informed Neural Networks* technology.

- New Implementation.
- Usable in real-world applications.
- Biochemistry.

Considerations:

- 3D problem.
- 2 domains (solute and solvent region).
- Singularities
- A lot of loss terms needed, and some optional can be added.

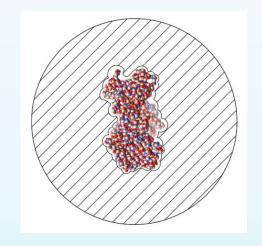

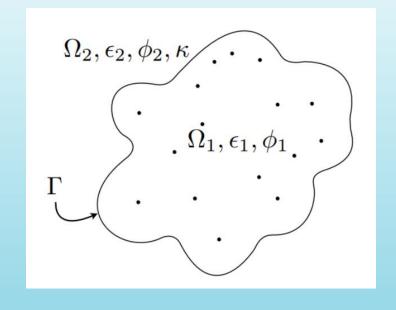

Poisson-Boltzmann Equation

- Applicable to macromolecules in a polarizable media.
- Obtained using the Implicit Solvent Model.

$$\begin{cases} \nabla^2 \phi_1 = -\frac{1}{\epsilon_1} \sum_k q_k \delta(\mathbf{x} - \mathbf{x}_k) & \mathbf{x} \in \Omega_1 \\ \nabla^2 \phi_2 = \frac{2c^{\infty} q_e}{\epsilon_2} \sinh\left(\frac{\phi_2 q_e}{k_b T}\right) & \mathbf{x} \in \Omega_2 \end{cases}$$

Linearized:
$$\nabla^2 \phi_2 = \kappa^2 \phi_2$$
 $\kappa^2 = \frac{2c^\infty q_e^2}{\epsilon_2 k_b T}$

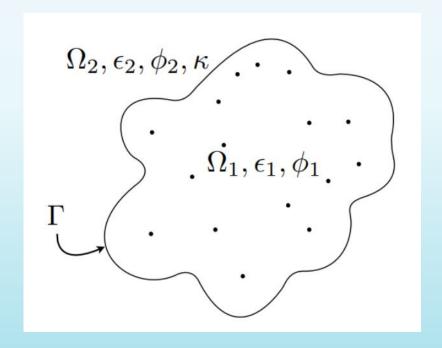

Poisson-Boltzmann Equation

• Interface conditions:

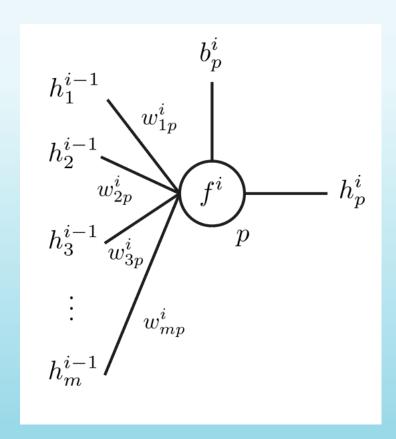

$$\begin{cases} \phi_1 = \phi_2 & \mathbf{x} \in \Gamma \\ \epsilon_1 \frac{\partial \phi_1}{\partial n} = \epsilon_2 \frac{\partial \phi_2}{\partial n} & \mathbf{x} \in \Gamma \end{cases}$$

Artificial Neural Networks (ANN)

- Operations in every perceptron (neuron).
- Considering the *p*-th perceptron of the *i*-th layer:

It has weights in the connections w_{mp}^i , bias b_p^i , and activation function f^i .

$$h_p^i = f^i \left(\sum_{j=1}^m h_j^{i-1} w_{jp}^i + b_p^i \right)$$

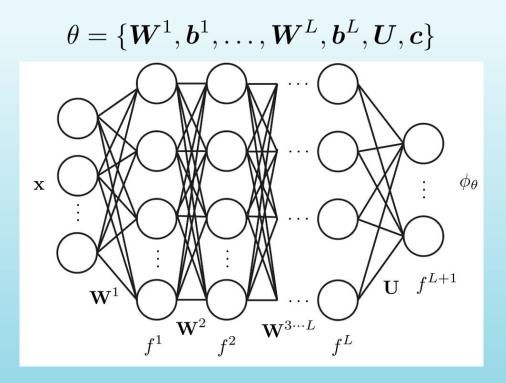

Artificial Neural Networks (ANN)

• Assembling multiple interconnected perceptrons forms an Artificial Neural Network (ANN).

$$\boldsymbol{\phi}_{ heta} = \mathcal{N}(\mathbf{x}; \mathbf{\theta})$$

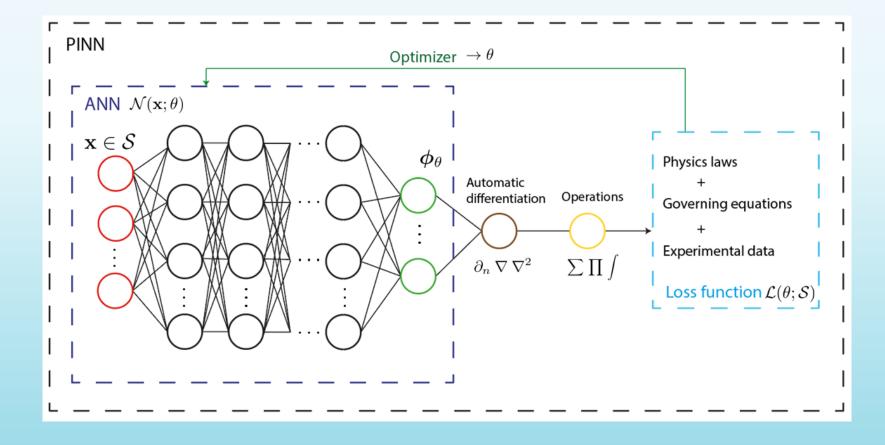

• Example: Fully Connected Neural Network

$$\begin{cases} \boldsymbol{h}^1 = f^1(\mathbf{x}\boldsymbol{W}^1 + \boldsymbol{b}^1) & i = 1 \text{ input layer} \\ \boldsymbol{h}^i = f^i(\boldsymbol{h}^{i-1}\boldsymbol{W}^i + \boldsymbol{b}^i) & 2 \le i \le L \text{ hidden layers} \\ \phi_{\theta} = f^{L+1}(\boldsymbol{h}^L\boldsymbol{U} + \boldsymbol{c}) & i = L+1 \text{ output layer} \end{cases}$$

PINNs (Physics Informed Neural Networks)

• The concept involves incorporating the equation to solve (residuals, boundary conditions, physics laws, etc.) into the loss function \mathcal{L} .

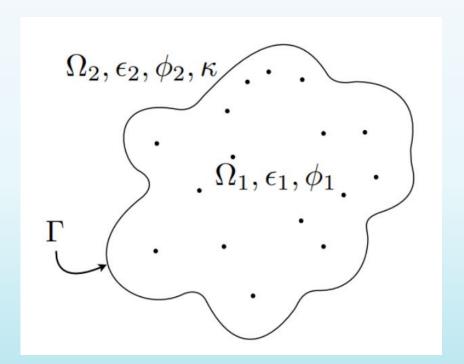

$$\theta^* = \operatorname*{argmin}_{\theta} \mathcal{L}(\theta; \mathcal{S})$$

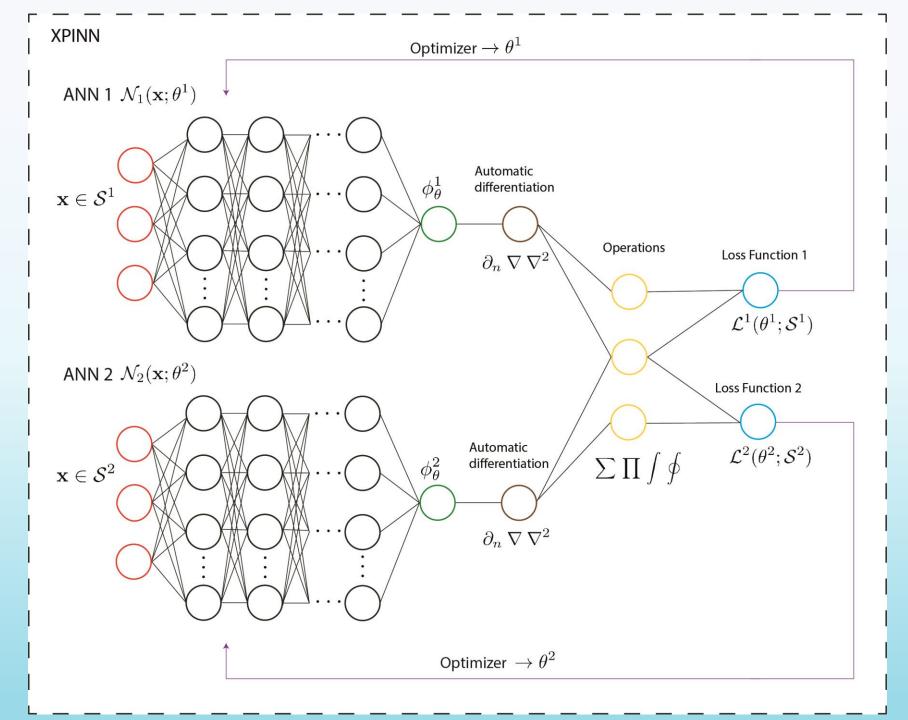

- 2 ANN that outputs the electrostatic potential:
 - N°1: Solute region.
 - N°2: Solvent region.

$$\phi \approx \begin{cases} \phi_{\theta}^{1} = \mathcal{N}_{1}(\mathbf{x}; \theta^{1}) & \mathbf{x} \in \Omega_{1} \\ \phi_{\theta}^{2} = \mathcal{N}_{2}(\mathbf{x}; \theta^{2}) & \mathbf{x} \in \Omega_{2} \end{cases}$$

- The loss functions will depend on both ANN, including the following terms:
 - Residual PBE.
 - Boundary conditions.
 - Interface relations.
 - Experimental data.
 - Gauss Law.

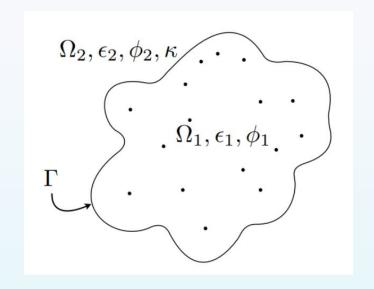

XPINNs for PBE:

- 2 ANN (solute and solvent regions).
- 2 Loss functions that depends on both ANNs.

$$\phi \approx \begin{cases} \phi_{\theta}^{1} = \mathcal{N}_{1}(\mathbf{x}; \theta^{1}) & \mathbf{x} \in \Omega_{1} \\ \phi_{\theta}^{2} = \mathcal{N}_{2}(\mathbf{x}; \theta^{2}) & \mathbf{x} \in \Omega_{2} \end{cases}$$

• Residuals:

$$\mathcal{L}_{pde}^{1}(\mathcal{S}_{pde}) = \frac{1}{N_{pde}} \sum_{x_i \in \mathcal{S}_{pde}} \left[\nabla^2 \phi_{\theta}^{1}(x_i) + \frac{1}{\epsilon_1} \sum_{k} q_k \delta(x_i - x_k) \right]^2$$

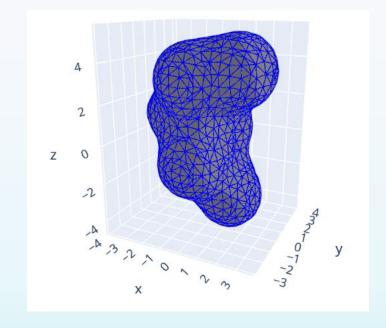

*Dirac delta will be approximated by a Gaussian function.

$$\mathcal{L}_{pde}^{2}(\mathcal{S}_{pde}) = \frac{1}{N_{pde}} \sum_{x_{i} \in \mathcal{S}_{pde}} \left[\nabla^{2} \phi_{\theta}^{2}(x_{i}) - \kappa^{2} \phi_{\theta}^{2}(x_{i}) \right]^{2} \qquad \qquad \delta(x) \approx \frac{1}{(2\pi)^{3/2} \sigma^{3}} e^{-\frac{1}{2\sigma^{2}} ||x||^{2}}$$

• Interface conditions (*j*-th ANN)

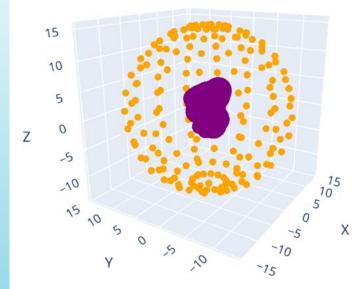

$$\mathcal{L}_{Iu}^{j}(\mathcal{S}_{I}) = \frac{1}{N_{I}} \sum_{x_{i} \in \mathcal{S}_{I}} \left[\phi_{\theta}^{j}(x_{i}) - \overline{\phi}_{\theta}(x_{i}) \right]^{2}$$

$$\mathcal{L}_{Id}^{j}(\mathcal{S}_{I}) = \frac{1}{N_{I}} \sum_{x_{i} \in \mathcal{S}_{I}} \left[\epsilon_{j} \partial_{n} \phi_{\theta}^{j}(x_{i}) - \overline{\epsilon \partial_{n} \phi}_{\theta}(x_{i}) \right]^{2}$$

• Boundary condition:

$$\mathcal{L}_{bc}^{2}(\mathcal{S}_{bc}) = \frac{1}{N_{bc}} \sum_{x_i \in \mathcal{S}_{bc}} \left[\phi_{\theta}^{2}(x_i) - \frac{1}{4\pi\epsilon_2} \sum_{k} \frac{q_k e^{-\kappa |x_i - x_k|}}{|x_i - x_k|} \right]^{2}$$

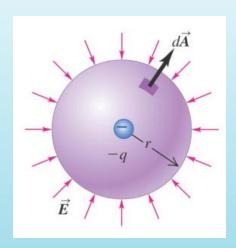

• "Known solution" in random positions (results from software pbj + 10% Noise) (*j*-th ANN):

$$\mathcal{L}_{data}^{j}(\mathcal{S}_{data}) = \frac{1}{N_{data}} \sum_{x_i \in \mathcal{S}_{data}} \left[\phi_{\theta}^{j}(x_i) - \phi_{\theta}^{*}(x_i) \right]^2$$

Gauss Law: Physics Law.

$$\oint_{\Gamma} \partial_n \phi \, dS = \frac{1}{\epsilon} \sum_{k} q_k$$

$$\mathcal{L}_{Gauss} = \left| \oint_{\Gamma} \overline{\epsilon \partial_n \phi_{\theta}}(x') \, dS(x') - \sum_{k} q_k \right|^2$$

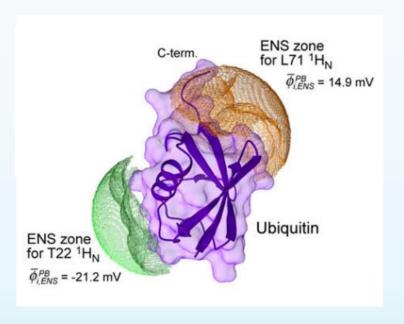

Experimental data ϕ_{ENS}

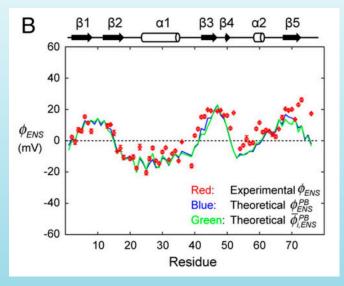

Results for experimental effective near-surface potential. Measured with NMR (Nuclear magnetic resonance).

• For each hydrogen atom *h*:

$$\phi_{ENS}(x_h) = \frac{-k_b T}{2q_e} \ln \left(\frac{\int_0^\infty r^{-4} e^{-\frac{q_e \phi_{\theta}(r)}{k_b T}} dr}{\int_0^\infty r^{-4} e^{\frac{q_e \phi_{\theta}(r)}{k_b T}} dr} \right)$$

$$\mathcal{L}_{E}(\mathcal{S}_{H}) = \frac{1}{N_{H}} \sum_{x_{h} \in \mathcal{S}_{H}} \left[\phi_{ENS,\theta}(x_{h}) - \phi_{ENS}(x_{h}) \right]^{2}$$

*YuPettitIwahara2021

Preconditioner

• Preconditioner for the set of parameters θ :

$$\mathcal{L}_{pre}(\theta; \mathcal{S}) = \frac{1}{N} \sum_{x_i \in S} \left[\phi_{\theta}(x_i) - \phi_*(x_i) \right]^2$$

```
Algoritmo 5 Resolver PDE con DCM preacondicionado

Input: Loss functions \mathcal{L} and \mathcal{L}_{pre}, Points \mathcal{S}, Hyperparameters

Initialize \theta_0, \mathcal{N}

for k = 1 to k = n_{\text{pre}} do

Calculate \phi_\theta = \mathcal{N}(\mathbf{x}; \theta_k)

Calculate \mathcal{L}_{\text{pre}}

Update \theta_{k+1} with ADAM(\theta_k, \nabla \mathcal{L})

end for

for k = n_{\text{pre}} + 1 to k = n do

Calculate \phi_\theta = \mathcal{N}(\mathbf{x}; \theta_k)

Calculate \mathcal{L} with PINN

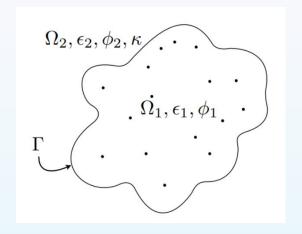

Update \theta_{k+1} with ADAM(\theta_k, \nabla \mathcal{L})

end for

Output: Parameters \theta
```

Solvation Energy

$$G_{solv} = \frac{1}{2} \sum_{k} q_k \phi_{reac}(x_k)$$
 $\phi_{reac} = \phi - \phi_{coulomb}$

• Green identities are used for getting the reaction potential at the point charges (uses the potential at interface):

$$\phi_{reac}(x_k) = \frac{1}{4\pi} \oint_{\Gamma} \frac{\overline{\partial \phi_1}}{\partial n} \frac{1}{|x_k - x'|} dS(x') - \frac{1}{4\pi} \oint_{\Gamma} \overline{\phi} \frac{\partial}{\partial n} \left(\frac{1}{|x_k - x'|} \right) dS(x')$$

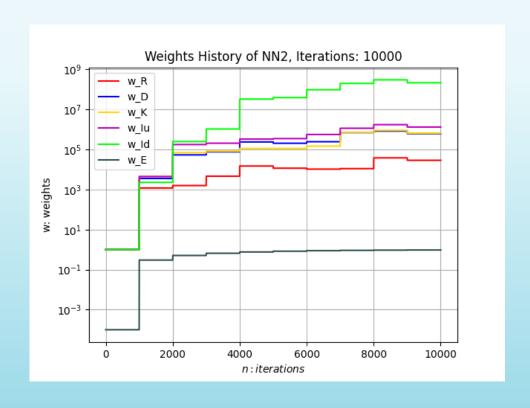

Weights balancing algorithm for loss terms

• The working principle is to balance the contribution of the different loss terms for the modification of the set θ .

$$\hat{w}_k = \frac{\sum_i \|\nabla_{\theta} \mathcal{L}_i\|}{\|\nabla_{\theta} \mathcal{L}_k\|}$$

$$w_{k,\text{new}} = \alpha w_{k,\text{old}} + (1 - \alpha)\hat{w}_k$$

• This algorithm works fine being applied every 1000 or 2000 iterations.

Implementation

- Full-batch approach:
 - Interface: ~600 points
 - Inner domain: ~1.500 points
 - Outer domain: ~6.000 points.
- Architecture: FCNN with a scale layer and a Fourier features layer.

$$y_{fourier} = [\cos(Bx), \sin(Bx)]$$

B: Normal distribution (non trainable), 256 features

- Hyperparameters: 4 hidden layers, 200 neurons per layer
- Activation function: **tanh**(**x**).
- Exponential decay learning rate, starting from 0,001.
- ADAM optimization algorithm.

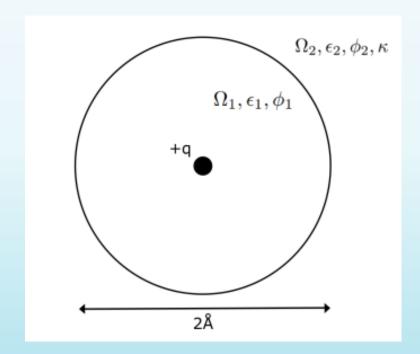

Test case: Born Ion

- Spherical molecule, 1 point charge.
- Analytical solution is known.
- Very simple test case.

$$\phi_1(r) = \frac{q}{4\pi} \left(\frac{1}{\epsilon_1 r} - \frac{1}{\epsilon_1 R} + \frac{1}{\epsilon_2 (1 + \kappa R) R} \right)$$

$$\phi_2(r) = \frac{q}{4\pi} \frac{\exp(-\kappa(r-R))}{\epsilon_2(1+\kappa R)r}$$

• L2 error at interface can be calculated.

Conclusions

- Fourier features and weights balancing algorithm are needed for good results.
- Labeled data loss term is **required** for quick convergence.
- Experimental loss term (ϕ_{ENS}) improves convergence.
- Gauss Law loss term makes the solution **nonsensical**. (Integral loss term?).
- Full batch approach works fine to this problem. Samples or multiple batches can be tested.
- The solvation energy predictions consistently **underestimated** the actual values.
- The best configuration for Born Ion is **not necessarily** the best for other molecules.
- More tests are needed. Will it be useful for "big" molecules?
- Future tests: Regularized equation? Avoid singularities.
